

3. Find the route taken by the animal. Place the **GARDEN SCENT-ry** on the path between the animal's home and the plantings you wish to protect. We successfully used one strategically placed **GARDEN SCENT-ry** to protect a 16' x 16' vegetable garden from a family of woodchucks.
4. We encourage you to experiment with repellents. We recommend using a log chart to track your results (see p 4). We offer some solutions we know to have worked — but this does not guarantee they will work for your situation. You may find new repellents that work even better, AND when you do, please let us know so we can tell others about your discovery.

PLEASE NOTE: In some instances the control of animals with any form of repellent system is impractical. For example, in some parts of the country deer have over-populated areas and are starving. In these situations solutions often extend beyond the immediate territory and signal problems which require consultation with wildlife managers. We strongly support thoughtful and humane solutions aimed at peaceful co-existence.

TO ASSEMBLE & FILL

* Assemble prior to filling. Use necessary force. The specially formulated plastic will not break. Turn upside down to see how the center post locks into position. The parts will fit together more easily the second time they are put together.

1. Attach top to center post. Firmly push together until permanently in place.
2. Pour (about 1 cup) or place repellents (lures or bait) directly into the reservoir. Do not overfill. When using liquids, we suggest you put a piece of paper towel, a rag, or sponge material in the reservoir prior to filling. This will help to prolong the effectiveness of many repellents.
3. Cover the reservoir with the screen. Insert post through screen and into reservoir. Press down firmly and turn until snapped into holding position.
4. The stake is optional. It can be easily inserted or removed.
5. The eyelet on top is used for hanging with a strong cord or wire. Be careful not to spill the repellents. Strong winds may cause the unit to swing and this movement could spill the repellents. Take care to ensure that if the repellent is spilled that it will not injure humans, pets, or other living things.
6. To refill, unlock post and remove screen.
